Fall 2016.

Grocery Store Inventory System

Delete item, Name search and Sorting
IPC44 Project (Milestone 6, Due Tue Dec6th 23:59)

In a grocery store, in order to be able to always have the proper number of items available on shelves, an inventory system is needed to keep track of items available in the inventory and make sure the quantity of the items does not fall below a specific count.

Your job for this project is to prepare an application that manages the inventory of items needed for a grocery store. The application should be able to keep track of the following information about an item:

1- The SKU number
2- The name (maximum of 20 chars)
3- Quantity (On hand quantity currently available in the inventory)
4- Minimum Quantity (if the quantity of the item falls less than or equal to this value, a warning should be generated)
5- Price of the item
6- Is the item Taxed

This application must be able to do the following tasks:

1- Print a detailed list of all the items in the inventory
2- Search and display an item by its SKU number
3- Checkout an item to be delivered to the shelf for sale
4- Add to stock items that are recently purchased for inventory (add to their quantity)
5- Add a new item to the inventory or update an already existing item
6- Delete an item from the inventory (optional for extra marks)
7- Search for an item by its name (optional for extra marks)
8- Sort Items by Name (optional for extra marks)

PROJECT DEVELOPMENT PROCESS

To make the development of this application fun and easy, the tasks are broken down into several functions that are given to you from very easy ones to more complicated one by the end of the project

Since you act like a programmer in this project, you do not need to know the big picture. The professor is your system analyst and designs the system and all its functions to work together in harmony. Each milestone is divided into a few functions. For each function, firstly, understand the goal of the function. Secondly, write the code for it and test it with the tester. Once your

code for the function passes the test, set it aside and pick up the next function. Continue until the milestone is complete.

The Development process of the project is divided into six milestones and therefore six deliverables. The first five deliverables are mandatory and conclude full submission of the project. The sixth milestone is optional; for those who want to do some extra work for the challenge and the bonus marks. For each deliverable, a tester program (also called a unit test) will be provided to you to test your functions. If the tester works the way it is supposed to do, you can submit that milestone and start the next. The approximate schedule for deliverables is as follows

- Kickoff week 7
- The UI Tools Due in 10 days
- The Application User Interface Due 5 days after UI
- The Item IO Due 7 days after Application User Interface
- Item Storage and Retrieval in Array Due 10 days after Item IO
- File IO and final assembly Due 5 days after Item Storage (project completed)
- Item Search by name, delete and sort (optional) 7 days after Project completion

FILE STRUCTURE OF THE PROJECT

For each milestone, a source file is provided under the name ipc_msX.c that includes the main() tester program. (Replace X with the milestone number from 1 to 6)

The main program acts like a tester (a unit test). Code your functions in this file and test them one by one using the main function provided. You can comment out the parts of the main program for which functions are not developed yet. You are not allowed to change the code in tester. Make sure you do not make any modifications in the tester.

MARKING:

Please follow this link for marking details:
https://scs.senecac.on.ca/~ipc144/dynamic/assignments/Marking_Rubric.pdf

MILESTONE 1: THE USER INTERFACE TOOLS (DUE SAT OCT 29TH)

Download or Clone milestone 1 from https://github.com/Seneca-144100/IPC_MS1

In ipc_ms1.c write the following functions:

```
void welcome(void);
```

Prints the following line and goes to newline

```
>--=== Grocery Inventory System ===---<
```

```
void prnTitle(void);
```

Prints the following two lines and goes to newline

```
>Row |SKU| Name               | Price  |Taxed| Qty | Min |   Total    |Atn<
>----+---+--------------------+--------+-----+-----+-----+------------|---<
```

```
void prnFooter(double gTotal);
```

Prints the following line and goes to newline

```
>-------------------------------------------------------+---------------<
```

Then if gTotal is greater than zero it will print this line: (assuming gTotal is 1234.57) and go to new line.

```
>                                          Grand Total: |     1234.57<
```

Use this format specifier for printing gTotal : **%12.2lf**

```
void clrKyb(void);
```

"clear Keyboard" Makes sure the keyboard is clear by reading from keyboard character by character until it reads a new line character.

Hint: In a loop, keep reading single characters from keyboard until newline character is read ('\n'). Then, exit the loop.

```
void pause(void);
```

Pauses the execution of the application by printing a message and waiting for user to hit <ENTER>.

Print the following line and DO NOT go to newline:

```
>Press <ENTER> to continue...<
```

Then, call clrKyb function.

Here the clrKyb function is used for a fool-proof <ENTER> key entry.

```
int getInt(void);
```

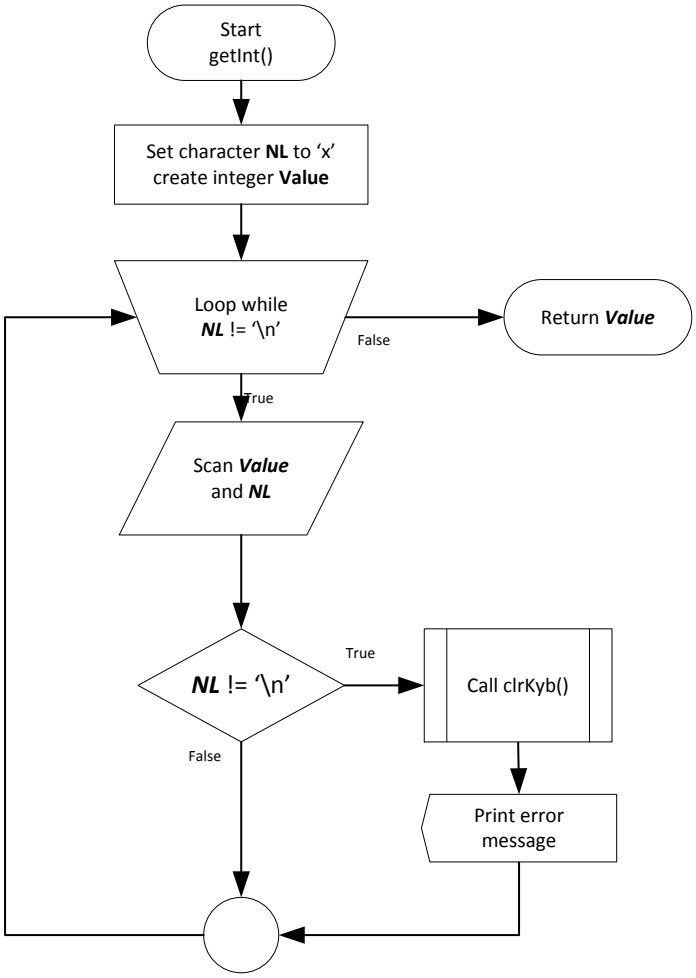
Gets a valid integer from the keyboard and returns it. If the integer is not valid it will print:

```
"Invalid integer, please try again: "
```

and try again.

This function must be fool-proof; it should not let the user pass, unless a valid integer is entered.

Hint: to do this, you can have two variables read back to back by scanf; an integer and then a character ("%d%c") and make sure the second (the character) is new line. If the second character is new line, then this guaranties that first integer is successfully read and also after the integer <ENTER> is hit. If the character is anything but new line, then either the user did not enter an integer properly, or has some additional characters after the integer, which is not good. In this case clear the keyboard, print an error message and scan the integer again. See the flowchart below.



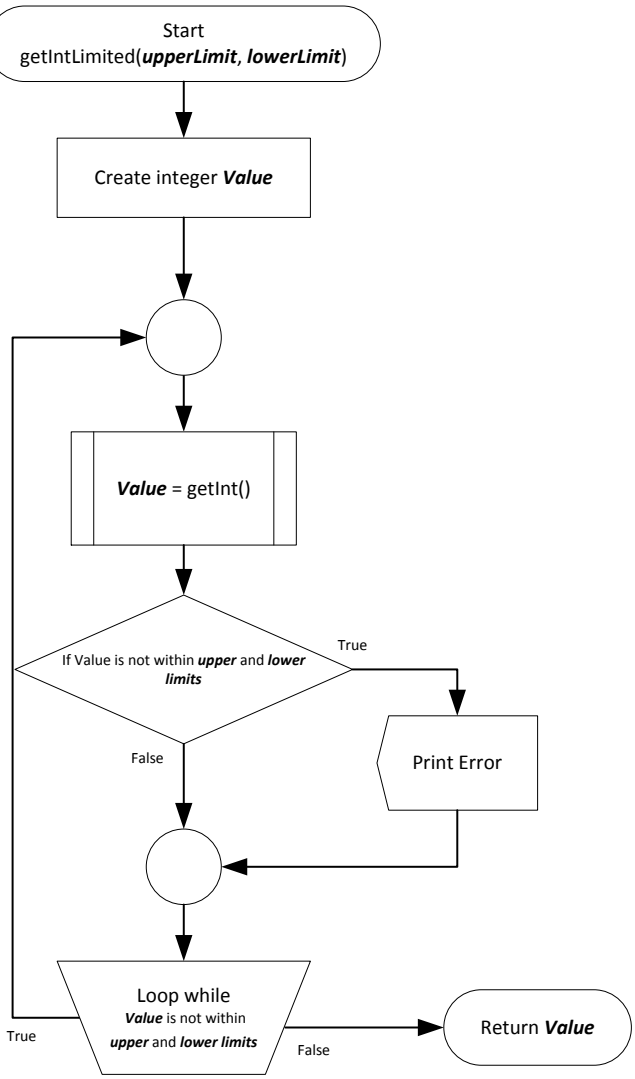
```
int getIntLimited(int lowerLimit, int upperLimit);
```

This function uses getInt() to receive a valid integer and returns it. This function makes sure the integer entered is within the limits required (between ***lowerLimit*** and ***upperLimit*** inclusive). If the integer is not within the limits, it will print:

> `"Invalid value, TheLowerLimmit < value < TheUpperLimit: "` <

and try again. *(Change the lower and upper limit with their values.)*

This function is fool-proof too; the function will not let the user pass until a valid integer is received within the lower and upper limit values. See below:



```
double getDbl(void);
```

Works exactly like ***getInt()*** but scans a double instead of an integer with the following error message:

```
"Invalid number, please try again: "
```

```
double getDblLimited(double lowerLimit, double upperLimit);
```

Works exactly like ***getIntLimited()*** but scans a double instead of an integer.

OUTPUT SAMPLE:

(UNDERLINED, *ITALIC* **BOLD** RED VALUES ARE USER ENTRIES)

```
---=== Grocery Inventory System ===---

listing header and footer with grand total:
Row |SKU| Name               | Price  |Taxed| Qty | Min |   Total    |Atn
----+---+--------------------+--------+-----+-----+-----+------------|---
-------------------------------------------------------+----------------
                                          Grand Total: |     1234.57
listing header and footer without grand total:
Row |SKU| Name               | Price  |Taxed| Qty | Min |   Total    |Atn
----+---+--------------------+--------+-----+-----+-----+------------|---
-------------------------------------------------------+----------------
Press <ENTER> to continue... <ENTER>
Enter an integer: abc
Invalid integer, please try again: 10abc
Invalid integer, please try again: 10
You entered: 10
Enter an integer between 10 and 20: 9
Invalid value, 10 < value < 20: 21
Invalid value, 10 < value < 20: 15
Your entered 15
Enter a floating point number: abc
Invalid number, please try again: 2.3abc
Invalid number, please try again: 2.3
You entered: 2.30
Enter a floating point number between 10.00 and 20.00: 9.99
Invalid value, 10.000000< value < 20.000000: 20.1
Invalid value, 10.000000< value < 20.000000: 15.05
You entered: 15.05
End of tester program for milestone one!
```

MS1 SUBMISSION:

To test and demonstrate execution of milestone 1, use the same data as the output example above.

If not on matrix already, upload your **ipc_ms1.c** to your matrix account. Compile and run your code and make sure everything works properly.

Before submission comment out your main function (the tester) in **ipc_ms1.c**. (Only the 9 functions you implemented are needed for the submission)

Then run the following script from your account: (replace profname.proflastname with your professors's Seneca userid)

```
~profname.proflastname/submit ipc_ms1 <ENTER>
```

and follow the instructions.

MILESTONE 2: THE APPLICATION USER INTERFACE (DUE SAT 5TH)

Download or Clone milestone 2 from https://github.com/Seneca-144100/IPC_MS2 and copy the functions in milestone 1 into ipc_ms2.c.

Now that the user interface tools are created and tested, we are going to build the main skeleton of our application. This application will be a menu driven program and will work as follows:

1- When the program starts the title of the application is displayed.
2- Then a menu is displayed.
3- The user selects one of the options on the Menu.
4- Depending on the selection, the corresponding action will take place.
5- The Application will pause to attract the user's attention
6- If the option selected is not Exit program, then the program will go back to option 2
7- If the option selected is Exit program, the program ends.

The above is essentially the pseudo code for any program that uses a menu driven user interface.

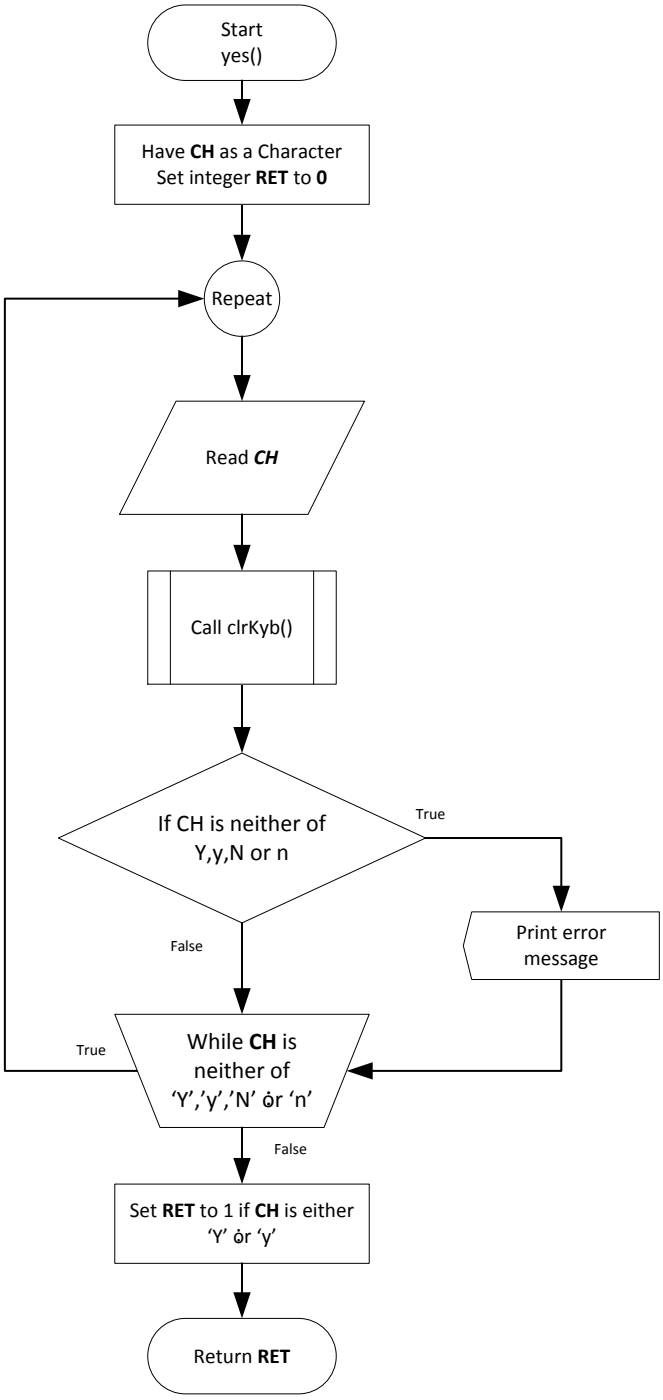
To accomplish the above create the following three functions:

```
int yes(void)
```

Receives a single character from the user and then clears the keyboard (`clrKyb()`). If the character read is anything other than "Y", "y", "N" or "n", it will print an error message as follows:

>`Only (Y)es or (N)o are acceptable:` **<**

and goes back to read a character until one of the above four characters is received. Then, it will return 1 if the entered character is either "y" or "Y", otherwise it will return 0.



Start
yes()
Have **CH** as a Character
Set integer **RET** to **0**
Repeat
Read ***CH***
Call clrKyb()
If CH is neither of
Y,y,N or n
True
Print error
message
False
While **CH** is
neither of
'Y','y','N' or 'n'
True
False
Set **RET** to 1 if **CH** is either
'Y' or 'y'
Return **RET**

`int menu(void)`

Menu prints the following options:><
>1- List all items<
>2- Search by SKU<
>3- Checkout an item<
>4- Stock an item<
>5- Add new item or update item<
>6- delete item<
>7- Search by name<
>0- Exit program<
>> <
Then, it receives an integer between 0 and 7 inclusive and returns it. Menu will not accept any number less than 0 or greater than 7 (Use the proper UI function written in milestone 1).

`void GrocInvSys(void)`

This function is the heart of your application and runs the whole program.

GrocInvSys, first, displays the welcome message and skips a line and then displays the menu and receives the user's selection.

If user selects 1, it displays:
>List Items!< and goes to newline

If user selects 2, it displays:
>Search Items!< and goes to newline

If user selects 3, it displays:
>Checkout Item!< and goes to newline

If user selects 4, it displays:
>Stock Item!< and goes to newline

If user selects 5, it displays:
>Add/Update Item!< and goes to newline

If user selects 6, it displays:
>Delete Item!< and goes to newline

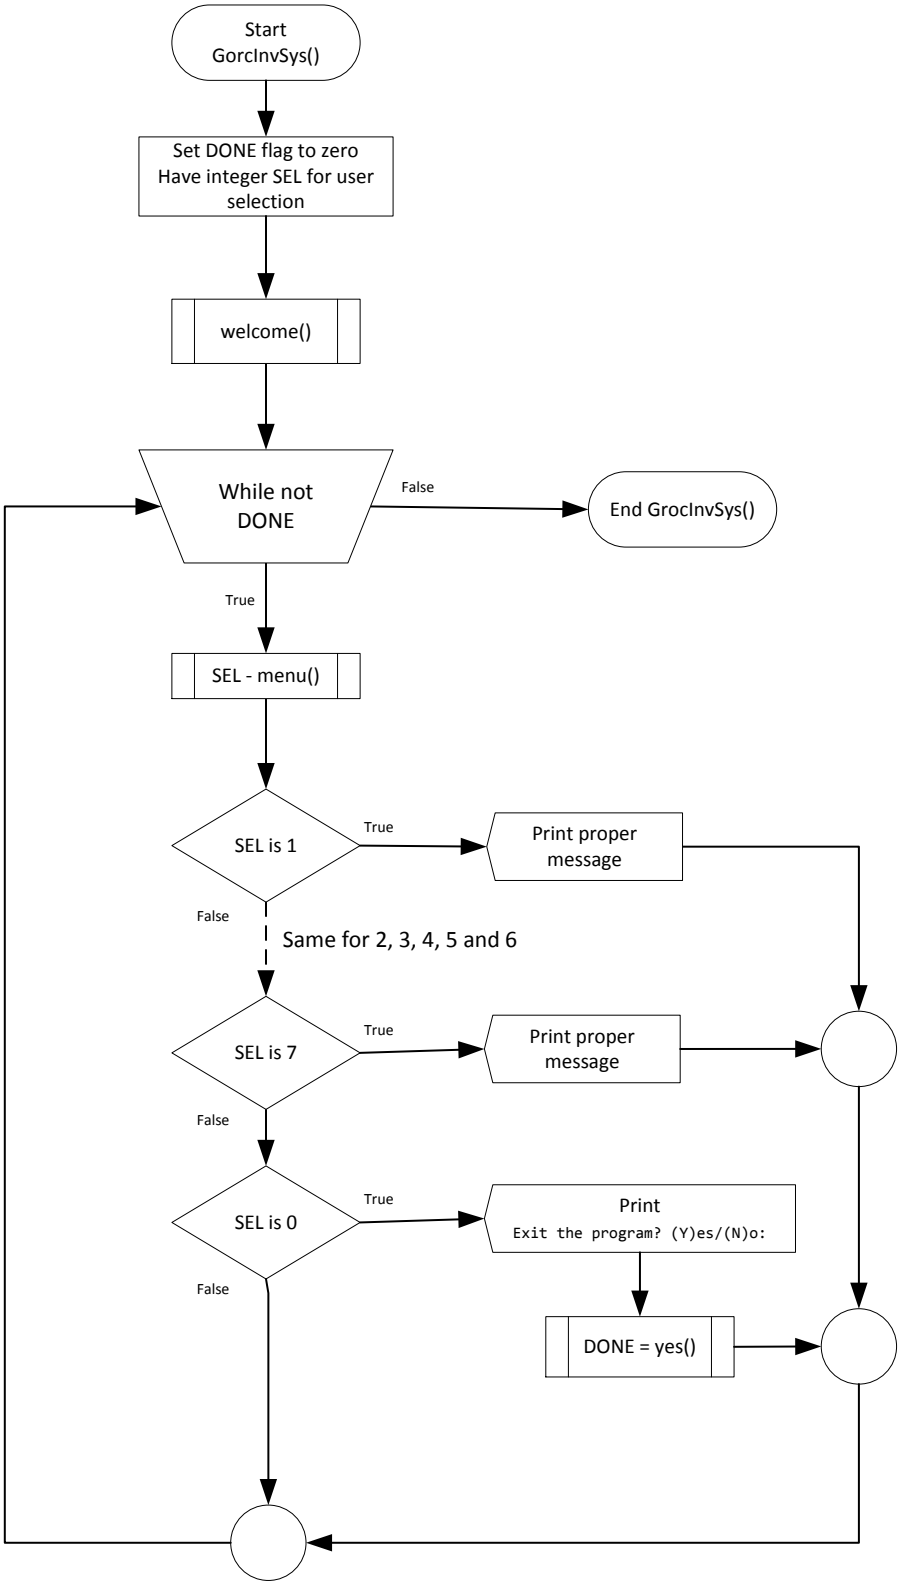
If user selects 7, it displays:
>Search by name!< and goes to newline

After receiving a number between 1 and 7, it will pause the application and goes back to display the menu.

If user selects 0, it displays:

```
>Exit the program? (Y)es/(N)o): <
```

and waits for the user to enter “Y”, ”y”, “N” or “n” for Yes or No.
If the user replies Yes, it will end the program, otherwise it goes back to display the menu.



Start
GorcInvSys()
Set DONE flag to zero
Have integer SEL for user selection
welcome()
While not DONE
False
End GrocInvSys()
True
SEL - menu()
SEL is 1
True
Print proper message
False
Same for 2, 3, 4, 5 and 6
SEL is 7
True
Print proper message
False
SEL is 0
True
Print
Exit the program? (Y)es/(N)o:
False
DONE = yes()

OUTPUT SAMPLE:

(UNDERLINED, *ITALIC* **BOLD** RED VALUES ARE USER ENTRIES)

```
---=== Grocery Inventory System ===---

1- List all items
2- Search by SKU
3- Checkout an item
4- Stock an item
5- Add new item or update item
6- delete item
7- Search by name
0- Exit program

> 0
Exit the program? (Y)es/(N)o : x
Only (Y)es or (N)o are acceptable: n
1- List all items
2- Search by SKU
3- Checkout an item
4- Stock an item
5- Add new item or update item
6- delete item
7- Search by name
0- Exit program
```

```
> 0
Exit the program? (Y)es/(N)o : y
```

MS2 SUBMISSION:

To test and demonstrate execution of milestone 2, use the same data as the output example above.

If not on matrix already, upload your **ipc_ms2.c** to your matrix account. Compile and run your code and make sure everything works properly.

Before submission, comment out your main function (the tester) in **ipc_ms2.c**. (Only the 3 functions you implemented are needed for the submission)

Then run the following script from your account: (replace profname.proflastname with your professors's Seneca userid)

```
~profname.proflastname/submit ipc_ms2 <ENTER>
```

and follow the instructions.

MILESTONE 3: THE ITEM IO (DUE TUE NOV 15TH)

Download or Clone milestone 3 from https://github.com/Seneca-144100/IPC_MS3 and copy the functions in milestone 1 and the yes() function from milestone 2 into ipc_ms3.c.

Define the following values in ipc_ms3.c: (using #define)

```
LINEAR to be 1
FORM to be 0
STOCK to be 1
CHECKOUT to be 0
```

Also create a global constant double variable called TAX that is initialized to 0.13.

Continue the development of your project by implementing the following Item related functions:
Item related information is kept in the following structure (do not modify this):
structure:

```
struct Item {
   double price;
   int sku;
   int isTaxed;
   int quantity;
   int minQuantity;
```

```
   char name[21];
};
```

price: price of a unit of the item
sku: Stock Keeping Unit, a 3 digit integer
isTaxed: an integer Flag, if true (non-zero), the tax is applied in price calculations. The value of Tax is kept in the global constant double TAX variable.
quantity: the quantity of the time in the inventory.
minQuantity: the minimum quantity number in inventory; any inventory quantity value less than this will cause a warning to order more of this item later in development.
name: a 20 character, C string (i.e a 21 character NULL terminated array of characters) to keep the name of the item.

Implement the following Item related functions:

```
double totalAfterTax(struct Item item);
```

This function receives an Item and calculates and returns the total inventory price of the item by multiplying the price by the quantity of the item and adding TAX if applicable (if isTaxed is true).

```
int isLowQty(struct Item item);
```

This function receives an Item and returns true (1) if the Item quantity is less than Item minimum quantity and false (0) otherwise.

```
struct Item itemEntry(int sku);
```

This function receives an integer argument for sku and creates an Item and sets its sku to the sku argument value.
Then it will prompt the user for all the values of the Item (except the sku that is already set) in the following order:
Name, Price, Quantity, Minimum Quantity and Is Taxed.

To get the name from the user, use the this format specifier in scanf: **`"%20[^\n]"`** and then clear the keyboard using clrKyb() function.

This format specifier tells to scanf to read up to 20 characters from the keyboard and stop if "\n" (ENTER KEY) is entered. After this clrKyb() gets rid of the "\n" left in the keyboard.

Use the data entry functions you created in milestone 1 to get the rest of the values. (for Is Taxed, use the yes() function in milestone 2).
Here is the format of the data Entry: (Underlined *Italic* **Bold** Red values are user entries)

```
>        SKU: 999<
>       Name: Red Apples<
>      Price: 4.54<
>   Quantity: 50<
>Minimum Qty: 5<
>   Is Taxed: n<
```

```
void dspItem(struct Item item,int linear);
```

This function receives two arguments: an Item and an integer flag called linear.
This function prints an Item on screen in two different formats depending on the value of "linear" flag being true or false.
If linear is true it will print the Item values in a line as with following format:
1- bar char "|"
2- sku: integer, in 3 spaces
3- bar char "|"
4- name: left justified string in 20 characters space
5- bar char "|"
6- price: double with 2 digits after the decimal point in 8 spaces
7- bar char and two spaces "| "
8- taxed: Yes or No in 3 spaces
9- bar char and one space "| "
10- quantity: integer in 3 spaces
11- space, bar char and space" | "
12- minimum quantity: integer in 3 spaces
13- space and bar char " |"
14- Total price: double with 2 digits after the decimal point in 12 spaces
15- bar char "|"
16- if the quantity is low then three asterisks ("***") or nothing otherwise<>

Example:

```
>|999|Red Apples          |    4.54|   No|  50 |   5 |      227.00|<
```

If low value and Taxed:

```
>|999|Red Apples          |    4.54|  Yes|   2 |   5 |       10.26|***<
```

If linear is false (or in FORM format) then the values are printed as follows:

```
>        SKU: 999<
>       Name: Red Apples<
>      Price: 4.54< Two digits after the decimal point
>   Quantity: 50<
>Minimum Qty: 5<
>   Is Taxed: No<
```

If low value and Taxed:

```
>        SKU: 999<
>       Name: Red Apples<
>      Price: 4.54<
>   Quantity: 2<
>Minimum Qty: 5<
>   Is Taxed: Yes<
>WARNING: Quantity low, please order ASAP!!!<
```

```
void listItems(const struct Item item[], int NoOfItems);
```

This function receives a constant array of Items and their number and prints the items in list with the grand total price at the end.
Create an integer for the loop counter and a double grand total variable that is initialized to zero.
First print the Titles of the list using prnTitle() function.
Then it will loop through the items up to NoOfItems.
In each loop:

Print the row number (loop counter plus one), left justified in four spaces and then display the item in LINEAR format. Then add the total price of the current Item element in the array to the grand total value.

After loop is done print the footer by passing the grand total to it. (use prnFooter() function).

```
int locateItem(const struct Item item[], int NoOfRecs, int sku, int* index);
```

This function receives a constant array of Items and their number. Also an SKU to look for in the Item array. The last argument is a pointer to an index. The target of this index pointer will be set to the index of the Item-element in which the sku is found, otherwise no action will be taken on index pointer.
If an Item with the SKU number as the sku argument is found, after setting the target of the index pointer to the index of the found item, a true value (non-zero, preferably 1) will be returned, otherwise a false value (0) will be returned.

MS3 SUBMISSION:

To test and demonstrate execution of milestone 3, use the main() function provided in **ipc_ms3.c**.

If not on matrix already, upload your **ipc_ms3.c** to your matrix account. Compile and run your code and make sure everything works properly.

Before submission, comment out the main() function in **ipc_ms3.c**. (Only the functions you implemented are needed for the submission)

Then run the following script from your account: (replace profname.proflastname with your professors's Seneca userid)

```
~profname.proflastname/submit ipc_ms3 <ENTER>
```

and follow the instructions.

MILESTONE 4:
ITEM STORAGE AND RETRIEVAL IN AN ARRAY
(DUE NOV 23ND 23:59)

Before starting this milestone please correct your error messages for getIntLimited and getDblLimitted functions respectively:

```
>Invalid value, %d <= value <= %d: <
>Invalid value, %lf <= value <= %lf: <
```

Download or clone milestone 4 from https://github.com/Seneca-144100/IPC_MS4 and copy all your work (except the main function) from milestone 3 into ipc_ms4.c.

The tester program for this milestone is written in 5 separate units (functions).
Implement the functions of this milestone in the same order mentioned here. To test your implementation of each function, uncomment the corresponding tester in the **main()** function and compile.

For example if you are writing the **addItem()** function, your main() will look like this:

```
int main() {
   //searchTest();
   //updateTest();
   addTest();
   //addUpdateTest();
   //adjustQtyTest();
   return 0;
}
```

When you are done with testing all the functions, you can uncomment everything for a complete test of your milestone 4.

MILESTONE 4:

Add the following definitions to your program:

```
MAX_ITEM_NO      21
MAX_QTY          999
SKU_MAX          999
SKU_MIN          100
```

In this milestone, you are implementing 5 functions that work with an array of **Items:**

```
void search(const struct Item item[], int NoOfRecs);
```

The **search** function receives an array of items and its size and searches through the array for an **Item** with a specific **sku** that is received from the user. If found, it will display the item in FORM

format, otherwise it will print an error message.

DETAILS
Prompt:
>Please enter the SKU: <
then receive an integer between SKU_MIN and SKU_MAX.
Call the **locateItem()** function and see if the item is found.
If found, display the item , otherwise print:
>Item not found!< and go to new line.

```
void updateItem(struct Item* itemptr);
```

updateitem, modifies the fields of an Item. The function receives the address of the Item to update (itemptr).

DETAILS
Create an instance of **struct Item**.
Prompt:
>Enter new data:< and go to new line.
Use the **itemEntry()** function and the **SKU** of the Item pointed by **itemptr** to receive an Item and save it in the Item instance you just created.
Then ask the user to confirm the update by printing:
>Overwrite old data? (Y)es/(N)o: <
If user responds yes, overwrite the target of **itemptr** by the Item instance and print:
>---== Updated! ==---< and go to new line
Otherwise print:
>---== Aborted! ==---< and go to new line

```
void addItem(struct Item item[], int *NoOfRecs, int sku);
```

If the item array is not full, this function will ask the user to enter the data for an Item (with the SKU received through the argument list) and if the user confirms, it will add it to the array and add one to the target of **NoOfRecs** pointer.

DETAILS
Create an Item.
Check:
If the target of NoOfRecs is equal to MAX_ITEM_NO, print:
>Can not add new item; Storage Full!<
and exit the function.
Otherwise, using the **itemEntry()** function get the details of the new Item with the SKU from the argument list and Prompt:
>Add Item? (Y)es/(N)o: <

If the user replies yes, set the Item after the last one in the item array to the one you just got from the user and add one to the target of **NoOfRecs** pointer and print:
>--== Added! ==--< and go to new line and exit the function.
If the user replies no, print:
>--== Aborted! ==--< and go to new line and exit the function.

```
void addOrUpdateItem(struct Item item[], int* NoOfRecs);
```

addOrUpdateItem function, receives an SKU from the user and updates or adds an Item in an array of Items depending on the SKU being present in an item in the array or not.

DETAILS
Prompt:
>Please enter the SKU: <
Receive an integer within the limits of a valid SKU number; between SKU_MIN and SKU_MAX.
Try locating the item in the item array.
If found:
Display the item in FORM format and confirm that the user wants to update it by prompting:
>Item already exists, Update? (Y)es/(N)o: <
If the user replies yes, call the **updateItem()** function with the found Item in the array, otherwise print:
>--== Aborted! ==--< and go to new line and exit the function.
Otherwise (not found):
Call the **addItem()** function to add the item with the entered SKU at the end of the data in the array. Then exit the function.

```
void adjustQty(struct Item item[], int NoOfRecs, int stock);
```

Depending on the value of the stock argument being STOCK or CHECKOUT, this function will increase or reduce the quantity of the selected Item in the array by the value received from the user.
If stocking, (adding to storage) this value can vary between 0 to (MAX_QTY – item_quantity) and if checking out (removing from storage) this value can vary between 0 to item_quantity.

DETAILS
Prompt:
>Please enter the SKU: <
Get a valid SKU value from the user and try locating the item with the same SKU in the item array.
If not found, print:
>SKU not found in storage!< and go to new line and exit the function.
If found, display the item in FORM format and print this message:
>Please enter the quantity %s; Maximum of %d or 0 to abort: <

If the value of **stock** argument is STOCK then:
%s should be replaced by >`to stock`< and **%d** should be replaced by the maximum number of items that can be stocked without exceeding the `MAX_QTY` value, which is the `MAX_QTY` value minus the quantity of the item in stock.

If the value of **stock** argument is CHECKOUT then:
%s should be replaced by >`to checkout`< and **%d** should be replaced by the quantity of the item in stock.

Then check the value entered by the user, which must be between 0 and the quantity displayed in the preceding message.

If the number input is zero (0), then print >`--== Aborted! ==--`<, go to a new line and exit the function.

If the number input is not zero(0):

If the value of **stock** argument is STOCK then:
Increase the quantity of the item in the array by the amount received from the user and print: >`--== Stocked! ==--`< and go to new line.

If the value of **stock** argument is CHECKOUT then:
Reduce the quantity of the item in the array by the amount received from the user and print: >`--== Checked out! ==--` < and go to new line.

When finished processing, if the quantity of the item is low (less than the re-order point), print the following warning:
>`Quantity is low, please reorder ASAP!!!`< and go to a new line.

TESTER OUTPUT SAMPLES:

(UNDERLINED, *ITALIC* **BOLD** RED VALUES ARE USER ENTRIES)

```

MS4 SUBMISSION:

To test and demonstrate execution of milestone 4, use the tester functions provided in **ipc_ms4.c**.

If not on matrix already, upload your **ipc_ms4.c** to your matrix account. Compile and run your code and make sure everything works properly.

Before submission, comment out the main() function and all the tester functions in **ipc_ms4.c**. (Only the functions you implemented are needed for the submission)

Then run the following script from your account: (replace profname.proflastname with your professors's Seneca userid)

```
~profname.proflastname/submit ipc_ms4 <ENTER>
```

and follow the instructions.

MILESTONE 5:
FILE IO AND FINAL ASSEMBLY
(DUE NOV 29TH 23:59)

Download or clone milestone 5 from https://github.com/Seneca-144100/IPC_MS5 and copy all your work (all the functions done in past milestones) into ipc_ms5.c.

Define the following:

```
MAX_ITEM_NO   to 500

DATAFILE      to "items.txt"
```

There are two main() functions in ipc_ms5.c; one is to test the 4 functions implemented in this milestone and the other one is to run the main application. You must comment out one of them to use the other one.

ADJUSTMENTS TO ITEMENTRY FUNCTION:

Modify your `struct Item itemEntry(int sku)` and use getLimitedInt() and getLimitedDbl() to limit the following entries:

```
>        SKU: 999<
>       Name: Red Apples<
>      Price: 4.54< Limited  between 0.01 and 1000.00 inclusive
>   Quantity: 50< Limited between 1 and MAX_QTY inclusive
>Minimum Qty: 5<   Limited between 0 and 100 inclusive
>   Is Taxed: n<
```

MILESTONE 5, FILE IO:

Implement the following four functions:

```
void saveItem(struct Item item, FILE* dataFile);
```

This function writes the content of an Item, comma separated, in one line of a text file pointed by "datafile" argument in following format:

```
sku,quantity,minQuantity,price,isTaxed,name<NEWLINE>
```

All the above variables are written with no special formatting except for the price that is written with 2 digits after the decimal point.

Assume that the dataFile pointer is already open and ready to be written into.

```
int loadItem(struct Item* item, FILE* dataFile);
```

This function reads all the fields of an Item from one line of a comma separated text file using fscanf and stores them in the Item structure that is pointed by the “item” pointer in the argument list. The format in which the values are read are the same as the saveItem function. Note that the name field may contain spaces.

Assume that the dataFile FILE pointer is already open and ready to be read from.

The function returns true if fscanf reads the six items successfully.

```
int saveItems(struct Item* item, char fileName[], int NoOfRecs);
```

saveItems uses the saveItem function to write an entire array of Items into a file.

saveItems receives a pointer to an array of Items and the number of records in that array (NoOfRecs) and also the name of the file in which these items should be saved into.

saveItems opens a FILE using the filename received from the argument list for writing (overwrites the old file if it already exists).

If the file was not opened successfully, it will end the function returning zero.

If the file is opened successfully, it will go through all the elements of the array, “item”, up to the “NoOfRecs” and saves them one by one using the saveItem function.

Then it will close the FILE and exits the function returning one (true);

```
int loadItems(struct Item* item, char fileName[], int* NoOfRecsPtr);
```

loadItems uses the loadItem function to read all the records saved in a file into the “item” array and sets the target of the “NoOfRecsPtr” to the number of Items read from the file.

loadItems receives a pointer to an array of Items and another pointer pointing to the number of records read from the file (NoOfRecsPtr) and also the name of the file in which these items are stored in.

loadItems opens a FILE using the filename received from the argument list for reading.

If the file is not opened successfully, it will end the function returning zero.

If the file is opened successfully, using loadItem it will read the records from the file until loadItem fails, counting the number of Items read at the same time.

Then it will set the target of NoOfRecsPtr pointer to the number of Items read.

Finally it will close the FILE and exits the function returning one (true);

MILESTONE 5, FILE IO TESTER:

To test the FILE IO functions, uncomment the main() function in TESTER section of ipc_ms5.c file and comment the other main function and run the program.

You should have the following output:

```
**********Testing saveItem:
Your saveItem saved the following in test.txt:
275,10,2,4.40,0,Royal Gala Apples
386,20,4,5.99,0,Honeydew Melon
240,30,5,3.99,0,Blueberries
****************************
They have to match the following:
275,10,2,4.40,0,Royal Gala Apples
386,20,4,5.99,0,Honeydew Melon
240,30,5,3.99,0,Blueberries
**********END Testing saveItem!

Press <ENTER> to continue...
**********Testing loadItem:
Your loadItem loaded the following from test.txt:
|275|Royal Gala Apples   |    4.40|   No|  10 |   2 |       44.00|

**********END Testing loadItems!

Press <ENTER> to continue...
Done!
```

MILESTONE 5, FINAL ASSEMBLY:

After the implementation of the four FILE IO functions is complete, comment out the main() function in the TESTER section for the FILE IO and uncomment the other main();

In your `void GrocInvSys(void)` function, done in Milestone 2, do the following:

- Create an array of Items. Use `MAX_ITEM_NO` for its size.
- Create an integer variable to Hold the number of records read.
- After the welcome() message use the loadItems() function to fill the Items array you created with the Item records kept in a the data file. The name of the data file is defined in `DATAFILE`.
- If the loadItems failed, print the following message and exit the program:
  `"Could not read from %s.\n"`, replace %s with defined value in `DATAFILE`.
- If loadItems is successful, run the menu section and action selection:
  - If 1 is selected:
    Call the listItems() function passing the item array and the number of records read.
  - If 2 is selected:
    Call the search() function passing the item array and the number of records read.
  - If 3 is selected:
    Call the adjustQty() function passing the item array, the number of records and `CHECKOUT`.
    Then call the saveItems() function passing the item array, `DATAFILE`, and the number of records read to apply the changes to the `DATAFILE`.
    If saveITems() fails, print the following message:
    `"Could not update data file %s\n"` replacing %s with `DATAFILE`.
  - If 4 is selected:
    Do exactly what you have done in option three but pass `STOCK` to adjustQty instead of `CHECKOUT`.

- If 5 is selected:
  Call the addOrUpdateItem() function passing the item array and the address of the number of records read.
  Then call the saveItems() function passing the item array, DATAFILE, and the number of records read to apply the changes to the DATAFILE.
  If saveITems() fails, print the following message:
  "Could not update data file %s\n" replacing %s with DATAFILE.
  - Note: as you see the save procedures in options 3,4 and 5 are identical. You could create a function and call it to prevent redundancy.
- If 6 or 7 is selected:
  Print: "Not implemented!\n" and pause();
- Option 0 remains the same.

MS5 SUBMISSION:

TBA

OPTIONAL FOR IPC144:
MILESTONE 6:
DELETE ITEM, SEARCH BY NAME, SORTING
(DUE DEC 6TH 23:59)

Download or clone milestone 6 from https://github.com/Seneca-144100/IPC_MS6 and copy your ipc_ms5.c under ipc_ms6.c into IPC_MS6 directory.

Before staring MS6 add an eighth option to the menu:
"8- Sort Items\n"

And when selected print the message "Not implemented!\n" and pause();

Implement the following functions:

MILESTONE 6: (5% BONUS MARK)

DELETE ITEM

```
void deleteItem(struct Item* item, int* NoOfRecs);
```

Prompt the user to enter an SKU:
"Please enter the SKU: "
If the SKU is found in the item array, issue a warning message after displaying the item in FORM format:
"This item will be deleted, are you sure? (Y)es/(No): "
If the user confirms the deletion, the item is deleted from the array and number of items is updated accordingly. Finally, "Item deleted!\n" message is displayed. If the user does not confirm the deletion, the message "Delete aborted!\n" will be printed.
If SKU is not found, the message "Item not found!\n" will be printed.

Call this function if Option 6 of the program menu is selected and then pause().

Execution sample is at the end of this document.

MILESTONE 6: (5% BONUS MARK) *You can do this part only if Delete item is implemented.*

SEARCH BY NAME

```
void searchByName(struct Item* item, int NoOfItems);
```

Print this message:
"Please enter partial name: "
and then receive a string (that may contain spaces) from the user.
Search the item array for any item whose name matches the entered string.
This comparison must be case insensitive.
List all the matches in a list with the same format of option 1 of the program menu without a grand total.

If no item is found print:
"No matches found!\n"
Call this function if Option 7 of the program menu is selected and then pause().

Execution sample is at the end of this document.

MILESTONE 6: (10% BONUS MARK) *You can do this part only if search by name is implemented.*

SORTING

```
void sort(struct Item* item, int NoOfItems);
```

Display the following sub-menu:

```
"1- Sort by SKU\n"
"2- Sort by Name\n"
"0- Exit\n"
"> "
```

If user selects 0, exit the function.
If user selects 1, sort the items in the array based on the Sku number in ascending order.
If user selects 2, sort the items in the array based on the name in ascending order.

If options 1 or 2 are selected print the following message:
"List sorted by %s.\n" replace %s by "SKU" or "Name" based on the type of sort.
Then, give the user an option to save the items in the file in their current sorted sequence as follows:
"Would you like to save the sorted list in file? (Y)es/(N)o: "
If users responds "Yes", try to save the items, if successful print:
"Sorted list saved!\n"
If saving items fails print:
"Could not update data file %s\n" replacing %s with DATAFILE.
If user responds "No" to saving items print:
"Sorted list NOT saved!\n"

Call this function if option 8 of the program menu is selected and pause().

Execution sample is at the end of this document.
